1. Prove that matrix elements of the momentum operator in position space take the form

$$\langle x | \hat{\mathbf{P}} | x' \rangle = -i\hbar \frac{d}{dx} \delta(x - x') .$$

---

We consider the action of the commutator  $[\hat{\mathbf{X}}, \hat{\mathbf{P}}]$  on an arbitrary state  $\phi$ ,

$$[\hat{\mathbf{X}}, \hat{\mathbf{P}}] \phi(x) . \tag{1}$$

Starting with equation 1, we first write it in bra-ket notation as

$$[\hat{\mathbf{X}}, \hat{\mathbf{P}}] \phi(x) = \langle x | [\hat{\mathbf{X}}, \hat{\mathbf{P}}] | \phi \rangle . \tag{2}$$

Since  $[\hat{\mathbf{X}}, \hat{\mathbf{P}}] = i\hbar$ , we get

$$\langle x | [\hat{\mathbf{X}}, \hat{\mathbf{P}}] | \phi \rangle = \langle x | i\hbar | \phi \rangle . \tag{3}$$

On either side, we can introduce the identity operator as  $[\hat{\mathbf{X}}, \hat{\mathbf{P}}] \cdot \hat{\mathbf{1}}$  and  $i\hbar \cdot \hat{\mathbf{1}}$ , and use the position space completeness relation  $\int dx' |x'\rangle \langle x'| = \hat{\mathbf{1}}$  to obtain

$$\int dx' \langle x | [\hat{\mathbf{X}}, \hat{\mathbf{P}}] | x' \rangle \langle x' | \phi \rangle = \int dx' \langle x | i\hbar | x' \rangle \langle x' | \phi \rangle . \tag{4}$$

Expanding the commutator operation  $\langle x | [\hat{\mathbf{X}}, \hat{\mathbf{P}}] | x' \rangle$  as

$$\langle x | [\hat{\mathbf{X}}, \hat{\mathbf{P}}] | x' \rangle = \langle x | \hat{\mathbf{X}} \hat{\mathbf{P}} | x' \rangle - \langle x | \hat{\mathbf{P}} \hat{\mathbf{X}} | x' \rangle$$

and applying the action of  $\hat{\mathbf{X}}$  on  $|x'\rangle$  and  $\langle x|$ , we obtain

$$\int dx' (x - x') \langle x | \hat{\mathbf{P}} | x' \rangle \langle x' | \phi \rangle = \int dx' \langle x | i\hbar | x' \rangle \langle x' | \phi \rangle . \tag{5}$$

Since the state  $\phi(x)$  chosen was arbitrary, we get the weak equivalence

$$(x - x') \langle x | \hat{\mathbf{P}} | x' \rangle = i\hbar \langle x | x' \rangle . \quad (6)$$

We know  $\langle x | x' \rangle = \delta(x - x')$ , and using

$$\delta(x) = -x\delta'(x)$$

we get

$$(x - x') \langle x | \hat{\mathbf{P}} | x' \rangle = -i\hbar(x - x') \frac{d}{dx} \delta(x - x') . \quad (7)$$

And finally, dividing both sides by  $(x - x')$ , assuming  $x \neq x'$ , we get the required matrix element

$$\langle x | \hat{\mathbf{P}} | x' \rangle = -i\hbar \frac{d}{dx} \delta(x - x') . \quad (8)$$

□

## 2. Starting from the abstract ket form of the Schrodinger eqn. derive the Schrodinger eqn. in the co-ordinate basis

The Schrodinger eqn. in the abstract ket form is given as

$$\hat{\mathbf{H}} |\psi\rangle = E |\psi\rangle . \quad (9)$$

In the position basis,  $\hat{\mathbf{H}}$  can be expressed in the form of a matrix, while  $|\psi\rangle$  can be expressed in terms of components in the basis. In the position basis, the components of  $|\psi\rangle$  form the wavefunction

$$\langle x | \psi \rangle = \psi(x) . \quad (10)$$

The Hamiltonian becomes a matrix in the position basis, with components given by

$$H_{xy} = \langle x | \hat{\mathbf{H}} | y \rangle . \quad (11)$$

Applying this to equation 9. We multiply by  $\langle x |$  on the left side and insert an identity on the right hand side. The identity is given by

$$\hat{\mathbf{I}} = \int dy |y\rangle \langle y| \quad (12)$$

So, now we obtain

$$\int dy \langle x | \hat{\mathbf{H}} | y \rangle \langle y | \psi \rangle = E \langle x | \psi \rangle . \quad (13)$$

Simplifying to components, we get

$$\int dy H_{xy} \psi(y) = E \psi(x) \quad (14)$$

and now our components are

$$H_{xy} = -\frac{\hbar^2}{2m} \delta''(x-y) + V \delta(x-y) . \quad (15)$$

We plug this in to equation 14. We get

$$\int dy \left[ -\frac{\hbar^2}{2m} \delta''(x-y) \psi(y) \right] + \int dy V \psi(y) \delta(x-y) = E \psi(x) , \quad (16)$$

$$-\frac{\hbar^2}{2m} \int dy \delta''(x-y) \psi(y) + V \psi(x) = E \psi(x) . \quad (17)$$

Using Integration by Parts on the integral twice, we obtain

$$-\frac{\hbar^2}{2m} \int dy \delta(x-y) \psi''(y) + V \psi(x) = E \psi(x) , \quad (18)$$

$$-\frac{\hbar^2}{2m} \psi''(x) + V \psi(x) = E \psi(x) . \quad (19)$$

Upon generalising this a bit, we get

$$-\frac{\hbar^2}{2m} \nabla^2 \psi + V \psi = E \psi . \quad (20)$$

This is quite obviously, our Schrodinger's Equation in co-ordinate form.

### 3. Calculate the matrix elements of the time-evolution operator, i.e. the propagator, in position space.

We use the identity  $\int_{-\infty}^{+\infty} |p\rangle \langle p| dp = \hat{1}$  to get:

$$\langle x| U(t) |x'\rangle = \int_{-\infty}^{+\infty} \langle x|p\rangle \langle p|x'\rangle e^{-ip^2 t/2m\hbar} dp . \quad (21)$$

We use the representation of momentum eigenvectors in the position basis to obtain

$$\langle x| U(t) |x'\rangle = \frac{1}{2\pi\hbar} \int_{-\infty}^{+\infty} e^{ip(x-x')/\hbar} \times e^{-ip^2 t/2m\hbar} dp . \quad (22)$$

Finally, we integrate the resulting Gaussian to obtain the result,

$$\langle x| U(t) |x'\rangle = \left( \frac{m}{2\pi\hbar i t} \right)^{1/2} e^{im(x-x')^2/2\hbar t} . \quad (23)$$
